DETAILED ACTION

Allowable Subject Matter

1. Claim 4-7, 9-12 and 15 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-3, 8, 13,14, 16, 17, 18-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zhao et al. (6,261,963) in view of Welsch et al. (6,226,17).

Regarding Claim 1, Fig. 3 of Zhao et al. shows dielectric layer 120, copper layer 140 and barrier layer 325A. Zhao et al. disclose this barrier layer to be one of titanium nitride, titanium tungsten, nitrided titanium-tungsten, magnesium, or another suitable barrier material. Note column 5. Zhao et al. do not show this barrier layer to be an oxide layer doped with one of magnesium, calcium, strontium, beryllium, or barium. However, in the abstract section, Welsch et al. show a directionally grown capacitor anodes where the dielectric layer is doped with oxides of Ca, Mg, Sr, Be and Ba.

Regarding Claims 2, 3, 17, 19 and 20 the abstract section of Welsch et al. show a directionally grown capacitor anodes where the dielectric layer is doped with oxides

Regarding Claims 8 and 13 Figs. 3-10 show multiple layers of copper interconnect structure with multiple layers of dielectric and barrier.

Regarding Claims 14, 16 and 18, Columns 8-12 show the method of making a copper interconnect with multiple layers.

It would have been obvious to one of having ordinary skill in the art at the time the invention was made to have a barrier dielectric layer of oxide doped with calcium in Zhao et al. as taught by Welsch et al. because such structure would provide a better protection.
